

Validation Record

GOLDEN-AP-01 · WLAN authentication · synthetic fixture

Check	Expected observation	Result
Association	Client completes authentication	PASS
Log	No new AUTH_TIMEOUT event	PASS
Configuration	Shared keys match	PASS

Conclusion

Authentication succeeds after the approved shared-key update. The lab observation window contains no recurrence. This validates only the synthetic fixture and must not be generalized to a customer environment without evidence.

Evidence boundary

The result supports the shared-key mismatch diagnosis. It does not support a firmware defect, hardware replacement, or a claim of customer impact.
